Treasury Quotes with 1/32 Fractions

Enrico Schumann

es@enricoschumann.net

The function `quote32` is meant for pretty-printing of US treasury bond quotes; it provides no other functionality. `q32` is a short-hand for `quote32`.

If price is numeric, it is interpreted as a quote in decimal notation and translated into a price quoted in fractions of a point.

```
> quote32(100 + 17.5/32)
```

```
[1] 100-17+
```

If price is character, it is interpreted as a quote in fractional notation.

```
> q32("100'315") + 1/32
```

```
[1] 101-00+
```
